The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as citits media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisera and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnosis of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagnosis of interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleocides 8-100 of a sequence not defined in the specification, for amplifying a target
                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacterial meningitis; pneumonia; sepsis; otitis media; ear infection; antiinflammatory; antibacterial; immunostimulant; auditory; respiratory; gene therapy; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               27-MAR-2001; 2001GB-00007658
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (revised)
(first entry)
```

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

```
the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence. The target sequence are sequence, and where the parts of the primers having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes conding the proteins has been rendered inactive. The proteins, uncleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus nectia, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed a prendardise of filed, bubblished_pot_sequences. (Updated on 23-OCT-2003 to set fitp, wipo.int/pub/published_pot_sequences. the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular or proliferation or the activity of a gene in an operon required for the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway to proliferation or that inhibits cellular proliferation of an operan which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, s activity; (11) a culture comprising strains in which the gene or proliferation of an organism. The attents of a compound that inhibits the compound is activity; (11) a culture comprising strains in which the gene to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound discovery programs, or for screening homologous nucleic acids required for proliferation in cisolate candidate molecules for rational dantifying proteins or acreening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. arruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format 1953 DIGEVSELKPHRVIVIIQNGKEMSSTIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKK 2012 2013 DAGYVINLSKDTFIKPVFKKIBEKKEBENKPTFDVSKKKONPQVNHSQLNESHRKEDLQR 2072 The invention relates to an isolated nucleic acid comprising any one of DIGEVSELKPHRVTVTIQNGKEMSSTIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKK DAGYVINLSKOTFIKPVFKKIEBKKEBENKPTFDVSKKKONPQVNHSQLNESHRKEDLQR antibacterial; gene therapy; Streptococcus pneumoniae infection; Length 2140; 0; Indels pneumoniae antigenic protein sequence SeqID310. 100.0%; Score 799; DB 6; 100.0%; Pred. This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopes that can be used in pharmaceutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the activity. The present invention describes a composition (including the conclete acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing andicament such as a vaccine, which can be used to treat or prevent bacterial infections, particularly S. Decumenniae infections that cause pharymgitis, otitis media, pneumonia, bacteramia sepais and meningitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from aptemars and from tibozymes, antisense nucleic acide and aiRNA. This polypeptide sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1953 DIGEVSELKPHRVTVTIQNGKEMSSIIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKK 2012

                                                                                                                                                                                                                                                                                                                                                       This invention relates to novel isolated Streptococcus pneumoniae nucleic acid molecules and the antigenic polypeptides encoded by them. The invention may be useful for the production of compounds with an antibacterial activity or for gene therapy. The nucleic acid molecules, compositions and methods disclosed are useful for treating Streptococcus pneumoniae infection. The present sequence is that of an S pneumoniae protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DAGYVINLSKDTFIKPVFKKIEEKKEBENKPTFDVSKKKDNPQVNHSQLNESHRKEDLQR 120

The invention relates to an isolated nucleic acid molecule for detecting, preventing or treating pathological conditions resulting from bacterial infection. The isolated nucleic acid comprises: (a) any of the 2603 nucleotide sequences of ARA55236 to ARA67818; (b) a nucleotide sequence of ARA57818; (b) a nucleotide sequence of acid sequences of ARA57818; (b) a nucleotide sequence of acid sequences of ARA57818; (b) ARA641; or (c) a nucleotide sequence of at least 8 nucleotides in length, where the sequence is hybridizable to a nucleic acid having any of the nucleotide sequences in case above nucleic acid coperably linked to a transcription regulatory element; (c) a cell comprising the recombinant expression vector; (d) producing an comprising of at least 8 nucleotides of any of ARA57818; (s) treating a subject for S. pneumoniae plypeptide; (d) a recombinant or consisting of at least 8 nucleotides of any of ARA57818; (s) treating a subject for S. pneumoniae infection; (d) a recombinant or composition of an S. pneumoniae acid or ARA57818; (c) infection, comprising an amount of the above nucleic acid in a sample; (e) a computer readable medium having recorded the nucleotide sequences of ARA57818; (l) a computer readable medium having recorded the nucleotide sequences of ARA57818; (l) a computer readable medium having recorded the nucleotide sequences of ARA57818; (l) a computer or the composition of a Streptococcus nucleic acid in a sample; confarance of the ARA57818; (l) a computer based system for identifying the presence of a Streptococcus nucleic acid in a sample; confarance of the ARA57818; (l) a computer composition of a Streptococcus nucleic acid in a sample; confarance of the ARA57818; (l) a computer composition of computer based system for identifying the presence of a Streptococcus nucleic acid or a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fragments of the Streptococcus genome of commercial importance. The composition and methods are useful for diagnosing, preventing or treating bacterial infections, particularly S. pneumoniae infection. The present sequence represents a S. pneumoniae OFF amino acid sequence from the present invention. Note - The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 DAGYVINLSKDTFIXPVPKKIEEKKEBENKPTFDVSKKKDNPQVNHSQLNESHRKEDLQR 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       569
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 DTGEVSELKPHRVTVTIQNGKEMSSTIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKK 60
                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid molecules and encoded polypeptides useful for diagnosing, preventing or treating bacterial infections, particularly Streptococcus pneumoniae infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       510 DAGYVINLSKDTFIKPVFKKIEEKKEEENKPTFDVSKKKDNPQVNHSQLNESHRKEDLQR

Nucleic acid encoding antigenic peptide(s) from Streptococcus pneumoniae - or their epitope-containing fragments, useful in protective or therapeutic vaccines, and for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a protein from Streptococcus pneumoniae. The nucleic acid sequence encoding the Streptococcus pneumoniae protein and be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                KKONPQVNHSQLNESHRKEDLQREEHSQKSDSTKDVTATVLDKNNISSKSTTNNPNK 117

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated Streptococcus pneumoniae nucleic acids and polypeptides. The nucleic acids and proteins are useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, such as S. pneumoniae infection. These may also be used for drug screening procedures. The present sequence represents a Streptococcus pneumoniae polypeptide of the invention. Note: The sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from USPTO at

The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding SP028) one of 113 disclosed nucleic acids encoding 113 S. pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at least 50 or 100 contiguous nucleotides of the SP028 nucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae gene expression. The present sequence represents an S. pneumoniae antigenic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Staphylococcus epidermidis SR1 strain; infection; diagnosis; vaccination; endocarditis.
                                                                                                                                                                                                        Novel polynucleotide encoding Streptococcus pneumoniae polypeptides useful for producing vaccines for prevention or attenuation of infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 38 YKGELEKGYQPDGWEISGFEGKKDAGYVINLSKDTPIKPVFKKIEEKKEEENKPTFDVSK 97

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABQ84792 to ABQ84904 represents nucleic acids which encode the Streptococcus pneumoniae antigens given in ABP54557 to ABP54669. The S. pneumoniae antigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polynucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. ABQ84905 to ABQ85130 represent primers used in the cloning of S. pneumoniae ORPs (open readding frames) which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                  New Streptococcus pneumoniae antigens, useful for detecting Streptococcus and for preventing or attenuating disease caused by Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  38 YKGELEKGYQPDGWEISGPEGKKDAGYVINLSKDTPIKPVPKKIEEKKEEENKPTFDVSK 97

                                                                                                                                                                                                                                                                                                                                                                             ሯ
                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                            AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and ill) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53071 to AAH55090 represent objectically claimed S. epidermidis genomic DNA polymucleotide sequences from the present invention. AAH55091 to AAH55098 crepresent objectic sequences and primars which are used in the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present
                                                                                                                                                                                                                                                                                                                                                                                                                                                   6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         586 DSVNAQSLKP----ITIGNGKQIKQQSVKSGTKVLPHSKVMLMTDGBLTMP-DMTGWTKE 640

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     672

The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidermidis polypeptide with any of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as given in the specification. Also described are: a recombinant expression vector of (1); producing an S. epidermidis polypeptide, an isolated nucleic acid comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis infection, comprising a nucleic acid cited above and a carrier; treating a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis polypeptide or its fragment; a cupre preparation of an S. epidermidis polypeptide or its fragment; a vaccine composition for prevention or treatment of an S. epidermidis infection; detecting the presence of a Staphylococcus mucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sequence with SEQ ID NO: 1-3772 or its fragments; a computer based system for identifying fragments of the Staphylococcus genome of commercial importance; a computer based system for identifying fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment compositions of the Staphylococcus genome and/or plasmids; The methods and computer of an Staphylococcus epidermidis bacterial compositions of the present invention are useful for the diagnosis, infection, This is the amino acid sequence of a S. epidermidis bacterial
New isolated polypeptide and encoding mucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.
                                                                                                                          Claim 17; SEQ ID NO 5663; 741pp; English

the inventor in transfer of an interest of a cell. Also included are of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway consideration; (7) identifying a compound that influences the activity of required for proliferation, or that inhibits proliferation or the biological pathway in which a proliferation, required gene or the biological pathway in which a proliferation required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation and that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which the test compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for the derivative or a gene or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the collection of strains; or (13) identifying the target of a compound that inhibits the collection of strains; or (13) identifying the argued collection of strains or strains or securing for homologous nucleic acids are useful for for defining proliferation of succeening for homologous mucleic acids required for collection of succeening to some contraction and security of some contractions and security of some contractions or security of some contractions or security of some contractions or security of some co
                                                                                                                                                                                                                                                                                                                                                                              New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, R. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  윱
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a chimeric molecule that comprises a glutamateric rich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozotte aurface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition of a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive comprising the anti-MSP3 and anti-GLURP cantibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3 at on the mentioned elsewhere in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                70 KDTPIKPVPKKIEEKKEB------ENKPTPDVSKKKDNPQVNHSQLNESHRKE 116

The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-2, MSP-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-6, MSP-3-7 and MSP-3-8) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously expressed in P. falciparum at the erythrocytic stages and encoding proteins which have a Asn-Leu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite their N-terminal extremity and which are located at the merozoite of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           181 VLKAKEASS-----YDYIL------GWEFGGGVPEHKKEENMLSHLYVSSKD 221

Claim 2; SEQ ID NO 6262; 14pp; English.

The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAS SEO ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 545-1108). The cDNAs and proteins are from corn, soybean, arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a promoter region in a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region of plant with a recombinant DNA construct comprising a promoter region of plant with a seacciated with the property, and growing the transformed plant with a seacciated with the property, and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth regilators, for improving plant tolerance to plant disease, for galactomann production, for production of plant tolerance to extreme osmotic conditions for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of carbohydrate, introgen or phosphorance is modification of carbohydrate, introgen or phosphorance in the property and for yield improvement by modification of carbohydrate, introgen or phosphorance in the field of biochemistry and for yield improvement by modification of carbohydrate, introgen or phosphorance in the field of biochemistry and for yield improvement by providing improved plant growth and for plant pests or producing transgenic plants with improved condition, in the present invention are useful in the field of biological characteristics such as increased yield, improving plant tolerance to cold or heat, improving manipulation, but was obtain

immunotherapy of malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum GLURP(27-500)-MSP3(212-380) fusion protein.

Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition composition to mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in above, or a mixture of GLURP and MSP3 antigens as an immunogen, in crecombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive

The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the polymucleotide sequence encoding the GLURP-MSP3 fusion protein. The polymucleotide sequence is also useful in preparing a vaccine. The

The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the bolymucleotide sequence encoding the GLURP-MSP3 fusion protein. The polymucleotide sequence is also useful in preparing a vaccine. The vaccine is useful in treating and preventing malaria and for inducing an

Also described are: (1) nucleotide sequences (II) enrodium (II) and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification
                                                                                                                                                                                                                                                           485
                                                                                                                                                                                                                                                                                                                                                                                                                                                  599

of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                170

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
```

The present invention relates to a method for identifying candidate proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence

```
10;
attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not despend on the variable biochemical characterisation of proteins. ABO23500-ABO23617 represent outlier proteins identified from different pathogenic organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. described are: (1) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (11) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (111) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (1v) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive immunotherapy of malaria, and (v) a medicament for passive antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3 protein (amino acid residues 212-380).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The invention relates to an isolated nucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promiter operably linked to the nucleic acid conding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular confideration or the activity of a gene in an operor required for proliferation, (7) identifying a campound that influences the activity of the gene product or that has an activity against a biological pathway confideration, (7) identifying a campound that inhibits proliferation of an equired for proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the strains is present in a culture or collection of compound; a activity; (11) a culture comprising strains in which the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation are serening for homologous nucleic acids required for proliferation and some activity in the present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent of the printed specification, but was obtained in a learn of the present sequence is encoded by one of the present of the present of the present of the present of the present of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 DAGYVINLSKDTFIKPVFKKIEEKKEEEN--KPTFDVSKKKODNPQVNHSQLNESHRKEDL 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BXXXXX
                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA abgrance (ABL16175) and the encoded proteins (ABS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

the coll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a productor operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular or proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation or that inhibits cellular proliferation; (8) capable of crelular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or product is overexpressed or underexpressed; (12) determining the extent or proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or for screening for homologous nucleic acids required for for dentifying antisense nucleic acids required for confound that inhibits and acids and actional and the servent or for screening and dendication of an organism. The activity of the screening and acids are useful for charactery and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity and activity activity and activity and activity and activity and activity and activity and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               õ
                                                                                                                                                                                                                                                                                               New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        59 KXDAGYVINLSKDTF-----IKPVPKKIEBKKB-----BENKPTFDVSKKKD 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent din not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240 ELSEVNEHRKVIEKELNEKEEQKNVVEKKQEDINKEVEVLQDVIEKSVDYIN-SIKGVIS 298

                                                                                                                                                                                                                                                                                                                                                                                              The present interies. The present interies an interies of a condition of a compression of the present interies.

The present interies of the advance of the amplicon generated from a farget sequence comprising a sequence of at least 8-30, 35, 40, 45, 50, 65, 70, 75, 80, 85, 90, 95 or 100 consecutive nucleotides of any of the polymucleotide sequence of a least 8-30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95 or 100 consecutive nucleotides of any of the polymucleotide sequences as described above; (3) a UNA chip or vector comprising any of the polymucleotide sequences described above; (3) a composition of the polymucleotide described above; (5) a composition of the comprising a promoter operably linked to any of the nucleic acid sequences described above; (4) a host cell transformed by the vector of composition of the polymucleotide described above; (5) a composition of the comprising a carrier and the polymucleotide described above; (5) a composition of the composition of (5) to induce an immune response; (7) an isolated composition of (5) to induce an immune response; (7) an isolated composition of (5) to induce an immune response; (7) an isolated composition of (8) to composition of (9) and the polympetide of (7); (9) a method of detecting P. falciparum in biological samples, comprising contacting a biological sample with the copy of the polympetides of (7); (9) and the polympetides of (7); to an individual to induce an immune response in the individual; (11) and antidody that specifically binds to the P. falciparum polypetides of (7); can antigen-antibody complex or detecting the stimulation of T-cells in the subject with the polympetide of (7) and detecting the presence of an antigen-antide, and and antigen-antides and antigen-and antigen-and share and correcting the stimulation of T-cells in the polympetide of (7) and antigen-antity and antigen-antigen-antigen-antigen-and antigen-and antigen-antigen-antigen-antigen-antigen-antigen-antigen-antigen-antigen-antigen-antigen-antigen-antigen-antigen-antige
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostatic, anti-HIV, virucide, hepatotropic and antibacterial activities, and can be used in vaccines. The methods and compositions of the present invention are useful for inducing an immune response for the prevention and/or treatment of cancer and infectious diseases, such as AIDS, hepatitis, and bacterial infections. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represents a P. falciparum antigen amino acid sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated and/or purified Plasmodium falciparum polynucleotide sequences, useful in inducing an immune response for preventing and/or treating cancer and infectious diseases, such as AIDS, hepatitis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present invention describes an isolated and/or purified Plasmodium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ch 12.1%; Score 97; DB 8; Length 1791; 1 Similarity 24.0%; Pred.                                                                                                                                                                                                                                           The present invention relates to von Willebrand factor binding protein or polypeptide (vWb) from Staphylococci. The vWb and immunogens of vwb are useful in vaccines to combat infections caused by Staphylococci. The invention is also useful for detection of staphylococcal infection and purifying von Willebrand factor from a complex solution. The present sequence is Staphylococcus lugdunensis vWbl protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                          New von Willebrand factor binding protein from Staphylococci, useful for determining and treating staphylococcal infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide. This is an example of claimed hybrid polypeptide. This is an example of claimed hybrid polypeptide immoration abw88439-ADW88444 that comprise a modified S. claimes ORF0657n sequence ADW88433 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and differences between native ORF057n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and anethod for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to generate antibodies to therapeutic antibodies that target S. aureus.

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. C Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (III). (I) and collaboration comprising (I) or (III). (I) and collaboration antibody raised to infection. (I) and polyclonal antisers or a monoclonal artibody raised to immunogens comprising the sequences of (I), are useful in the detection of imfection with P. falciparum. Furthermore, (I) (especially when they can encreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the confound thromsome 2 and the subsequent identification of proteins cancoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and confounds and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA7078 to AAA70287 and AAB18144 to AAB18352 crepresent nucleotide and protein sequences given in the present confound in the present confound in the present confound in the present confound are not specifically mentioned within the present confound are not specifically mentioned within the
Plasmodium falciparum; chromosome 2; human malaria parasite; vaccine; antimalarial; malaria; protozoacide; infection; insecticide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection.
                                                                                                                                                                                                                                                                                                              Plasmodium falciparum chromosome 2 related protein SEQ ID NO:129

The inferior relates to a movel labrated nuclear dard molecule encoding of the fragment. The invention further comprises: a vector comprising the above nucleic acid molecule; a cell, preferably a heat cell, comprising the above nucleic acid molecule; a cell, preferably a flatinogen-binding polypeptide of the vector; a polypeptide, preferably a flatinogen-binding polypeptide and adversarial flatinogen-binding polypeptide of the vector; a polypeptide or its fragment; a process for producing the above nucleic acid molecule; a process for producing the above polypeptide or its fragment; a pharmaceutical composition, expresses the polypeptide or its fragment; a pharmaceutical composition, a selective part of the polypeptide or its fragment; methods for identifying an antagonist capable of reducing or inhibiting the activity of the polypeptide or its fragment, capable of binding to the polypeptide or its fragment, capable of binding to the polypeptide or its fragment, capable of binding to the polypeptide or its fragment, capable of binding to the polypeptide or its fragment, capable of binding to the activity of the polypeptide or its fragment, or its interaction partner; an antagonist identified by the above method; processes for in vitro diagnosis of a bacterial infection, preferably Streptococcus agalactiae and immobilized to the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide or the support material the fragment.

nucleic acid molecule. The fibrinogen-binding polypeptide has
antibacterial activity. The nucleic acids may be used in gene therapy to
treat disorders. The nucleic acid is used for manufacturing or generating
functional ribonucleic acids selected from ribozymes, antisense nucleic
acids and siRNA. The polypeptide or its fragment is useful for
manufacturing a medicament, especially a vaccine against bacterial
infection. The polypeptide is also used for manufacturing an antibody
that may be used for manufacturing a medicament for treating or
the may be used for manufacturing a medicament for treating or
preventing bacterial infections, especially S. agalactiae infections. The
polypeptide is also used as an antigen, or for isolating, purifying
and/or identifying an interaction partner of the polypeptide or its
fragment, or for generating a peptide binding to the polypeptide, such as
anticalines. It may also be used for manufacturing or generating a
c functional nucleic acid selected from aptemers and spiegelmers. This
sequence represents a fibrinogen-binding polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      124
                                                                                                                                                                                                                                                                                                                                                                                                                                      Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ŭ

novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83140). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of cofactors, prosthetic groups and transporters, cell membrane proteins and callular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for treatment of a bacterial S. agalactiae infection. The complete genome of Streptococcus agalactiae is given in ADV81204. Note: The

ADV87746-ADV89950). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, prospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleosides, regulatory functions, replication, conditions, sensitivity to medicines and/or analogues, functions related conditions, sensitivity to medicines and/or analogues, functions related conditions, blosynthesis of cofactors, prostbetic groups and cransposons, blosynthesis of cofactors, prostbetic groups and cransporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the abacterial S. agalactiae infection. Note: WO200292818A2 is equivalent for the present basic patent FR2824074A1. WO200292818A2 contains 6617 sequence whereas the present patent only contains 2344
                                                                                                                                                                                                                                                                                                                                                                            7;
                                                                                                                                                                                                                                                                                                                                                                                                                                    124
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            99
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kunst F;

novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83340). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism, including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of cofactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the detection and/or amplification useful for treatment of a bacterial S. agalactise infection. The complete genome of Streptococcus agalactise is given in ADV81204. Note: The present patent is an equivalent for the basic patent FR2824074A1, which

            aureus ORFO657n sequence ADM88438 containing amino acid substitutions that increase sequence similarity to ORF0190 ADM88432. The Pubrid polypeptides contain one or more epitopes for ORF0557n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0557n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to detect the presence of S. aureus, and being used to generate antibodies therapeutic antibodies that target S. aureus.
Immunogens of the invention ADW88439-ADW88474 that comprise a modified S.

Staphylococcus aureus infection.

```
The present sequence is that of a Staphylococcus aureus protein ORP0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and contain one or more epitopes for ORF0657n and contain one or more epitopes for ORF0657n and a method for evaluating the ability of an immunogen to produce a invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to therapeutic antibodies that target S. aureus.

Novel hybrid polypeptide immunogen comprising modified ORF0657n sequence, useful for inducing protective immune response in humans against

Jansen KU;

Anderson AS, Kuklin N,

PI; 2005-123069/13

```
The present sequence is that of a Staphylococcus aureus protein ORP0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88444 that comprise a modified S. the invention ADW88439-ADW88444 that comprise a modified S. aureus ORP0657n sequence ADW88438 containing amino acid substitutions that increase sequence similarity to ORP0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORP0657n and CARP0190. They were designed by taking into account the similarity and differences between native ORP0657n and ORP0190 protein sequences. The invention also provides mucleic acids encoding these hybrid polypeptides, and enchod for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus, and being used to generate antibodies to therapeutic antibodies that target S. aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 355 SVENSESMADÍFVEH-----PIKTGTLNGKKYMVMKTTNDDYWKDFMVEGKR----VRTI 405

New vaccines comprising Sp128 or Sp130 polypeptides, for treating and preventing pneumococcal infections, particularly infections caused by Streptococcus, e.g. otitis media, nasopharyngeal, bronchial, lung or blood infections.

Claim 8; Page 51-54; 54pp; English.

The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as otitis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisera and antibodies may also be used in diagnosing and treating pneumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and

  This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogenic or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnostic of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of antagnosis of interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

  New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or ear infection.
  The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleocides 8-100 of a sequence not defined in the specification, for amplifying a target

cc the first primer is substantially complementary to the target sequence the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound with the complementarity define the termini of the target sequence to protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus cateria, particularly 8. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Estandardise OS field) 8866666666666666666666668888

This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopse that can be used in pharmaccutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a medicament such as a vaccine, which can be used to treat or prevent bacterial infections, particularly S. pneumoniae infections that cause pharyngitis, otitis media, pneumonia, bacteraemia sepais and menhigitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from aptemers and selected from tibozymes, antisense nucleic acid selected from aptemers antigen control of the hyperimmune serum reactive antigen actumers and selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring a functional ribonucleic acid selected from a structuring an actument and a structuring a functional ribonucleic acid selected from a structuring antigen ant

The present sequence represents a protein from Streptococcus pneumoniae.

The nucleic acid sequence encoding the Streptococcus pneumoniae protein

can be useful in vaccines for inducing protective antibodies against

Streptococcus pneumoniae, for treatment or prevention of infection e.g.

pneumonia, otitis media or meningitis. Probes based on the nucleic acid

are used to detect Streptococcus infection (by usual hybridisation or

maplification methods), also for isolating Streptococcus genes or their

alelic variants. The protein can be used similarly to detect specific

allelic variants and instandard immunoassays, especially for diagnossing or

monitoring infections. Antibodies which bind the protein are used to

detect corresponding antigens, to purify the protein and for passive

immunisation (optionally coupled to a toxin). Vaccines are administered,

e.g. by injection, orally or through the skin, typically at 0.01-1000

   The invention relates to an isolated polynucleotide consisting of a Streptococcus pneumoniae nucleic acid (appearing as ADC45122 and encoding Streptococcus pneumoniae nucleic acids encoding 113 & pneumoniae antigens. Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polynucleotide consisting of at recombinant host call comprising the SP028 nucleic acid, and a recombinant host call comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae agene expression. The present sequence

  ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis lifections. The sequence can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site

The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and enroding an Staphylococcus epidermidis polypeptide with any of 3772-7544) as given in the specification. Also described are: a recombinant expression vector; a cell comprising a recombinant expression vector of (1); producing an S. epidermidis polypeptide, an isolated nucleic acid comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis infection, comprising a nucleic acid cited above and a carrier; treating a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; a subject for S. epidermidis infection; detecting the presence of a Staphylococcus nucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sequence with SEQ ID NO: 1-372 or its fragments; a computer based system for identifying fragments of the Staphylococcus genome of commercially importance; a computer based system for identifying fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus despendent of an Staphylococcus epidermidis bacterial infection. This is the amino acid sequence of a S. epidermidis bacterial of the staphylococcus epidermidis sequence of a S. epidermidis bacterial of the staphylococcus sequence of a S. epidermidis bacterial of the staphylococcus epidermidis bacterial of the staphylococcus sequence of a S. epidermidis bacterial of the staphylococcus epidermidis bacterial of the staphylococcus epiderm

   The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-2, MSP-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-7 and MSP-3-8) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously proteins which have a Asn-Ieu-Arg-Asn or Asn-Leu-Arg-Lys signature at their N-terminal extremity and which are located at the merozoite their N-terminal extremity and which are located at the merozoite of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (1) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection

The present invention relates to a method for identifying candidate proteins in pathogen useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proteins (e.g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not despend on the variable biochemical characterisation of proteins. ABO21500-ABO23617 represent outlier proteins identified from different pathogenic organisms

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-314) of GLURP (given as SEQ ID Noi-1) and a Merozoite surface protein 3 (MSP3) moiety consisting of amino acid residues 12-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunicated with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described and/or secondinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive malaria, and (v) a medicament for passive malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a waiture of GLURP antibodies. The chimeric molecule of the invention or a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3a to MSP3 fragment. Note: The present sequence given as SEQ ID No:7 in the Sequence Listing is not mentioned elsewhere in the specification. The present invention describes an isolated and/or purified Plasmodium falciparum (malaria parasite) antigen polynucleotide sequence, encoding con immunogenic peptide. Also described: (1) a primer or detection probe for an immunogenic peptide. Also described by primer or detection probe for hybridisation with a target sequence or the amplicon generated from a target sequence comprising a sequence of at least 8-30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 90, 95 or 100 consecutive nucleotides of any of the polynucleotide sequences described above; (2) a DNA chip comprising any of the polynucleotide described above; (3) a composition comprising a carrier and the polynucleotide described above; (5) a composition comprising a carrier and the polynucleotide described above; (5) a method of inducing an immune response in an individual comprising the administration of inducing an immune response in an individual comprising the administration of inducing an immune response; (7) an isolated by the polynucleotide described above; (6) a composition comprising a carrier and the polypeptide comprising ordereding a biological sample with the comprising contacting a biological sample with the isolated polynucleotides with nucleic acids contained in the sample; (10) a method of contained in the sample; (10) a method of contained in the sample; (11) an individual to induce an immune response in the individual; (11) an composition comprising the polypeptides of (7); can individual to induce an immune response in the individual; (11) an composition composition comprising the polypeptides of (7); can individual to induce an immune response in the individual; (11) an composition composition composition of a composition composition of a composition composition composition of a composition composition of a composition composition of a composition of a composition composition of a composition of a composition of a composition composition of a composition composition of a composition of a composition composition composition of a composi the sample. The P. falciparum antigens and immunogenic peptides have cytostatic, anti-HIV, virucide, hepatotropic and antibacterial carcivities, and can be used in vaccines. The methods and compositions of the present invention are useful for inducing an immune response for the prevention and/or treatment of carcer and infectious diseases, such as Thus, hepatitis, and bacterial infections. The present sequence represents a P. falciparum antigen amino acid sequence, which is used in the exemplification of the present invention. New isolated and/or purified Plasmodium falciparum polynucleotide sequences, useful in inducing an immune response for preventing and/or treating cancer and infectious diseases, such as AIDS, hepatitis, and Gaps 68; 11.7%; Score 105; DB 8; Length 1791; 23.7%; Pred. the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid;

(2) a host cell containing the vector; (3) an isolated on the fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation; (9) identifying a gene required for cellular proliferation; (9) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an

The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) molety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) molety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also described abore it i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a mixture of malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation or a mixture of GLURP and malaria, This sequence represents Plasmodium falciparum MSP3 protein (amino acid residues 212-380).

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide denoted 0657nHybrid3. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88433-ADW88438 containing amino acid substitutions that increase sequence similarity to ORF0657n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0657n and ORF0190 protein similarity and differences between native ORF0657n and ORF0190 protein similarity and differences between native ORF0657n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides infection using an animal (mouse or rat) model. The hybrid polypeptides that the presence of S. aureus and being used to provide protective immunity against S. aureus infection, being used to generate antibodies to detect the presence of S. aureus, and being used

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60510-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent for a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office. The complete

   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are particularly agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or streening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament components of the complex is useful for the manufacture of a medicament corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was corresponded from the EPO in electronic format).

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant as uch as maize or soybean. The method of producing a transformed plant is a crop plant such as maize or soybean. The method of producing a transformed plant to such as migroved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polymucleotide or polypoptide is useful for improving plants with improved plant properties, eg. improved cold, heat or drought tolerance, tolerance to herbicides, extreme sements conditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. Note: The sequence data for this patent did not soppe of the invention. Note: The sequence data for this patent did not form the printed specification but was obtained in electronic

nucleotide sequences (1; ADV7880-ADV78998 and ADV83341-ADV85476) and novel polypeptides (1; ADV7880-ADV8998 and ADV83205-ADV83340). The nucleotide sequences encode polypeptides of saglactiae involved in the synthesis of amino acids, cell menbranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, concleotide metabolism including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, blosynthesis of cofactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for treatment of abacterial S. agalacticae infection. The complete genome of Streptococcus agalacticae is given in ADV81204. Note: The present patent is an equivalent for the basic patent FR2824074A1, which
